

CUDA-Q on Brev

Experience CUDA-Q on the cloud with quick and easy setup

- **Set up CUDA-Q via Brev**

- [NVIDIA Brev](#), as a GPU hub, streamlines access to compute instances on various clouds
- Follow the [instructions](#) to set up the CUDA-Q environment with sample applications on Brev

The screenshot displays the 'CUDA-Q Application Hub' interface. At the top, a text block explains that the hub makes it easy to get started with CUDA-Q without local installation, guiding the user to click the 'Deploy Launchable' button, then 'Go to Instance Page', wait for the GPU to spin up (~16 minutes), and finally click 'Access Notebook'. Below this, the interface is divided into several sections: 'Container' with a 'VM Mode' option and a note about post-installation scripts; 'Files' with a 'GitHub Repo: cuda-quantum' link; 'Compute' showing the selected 'L4' instance with '1 GPUs x 4 CPUs | 16 GiB' and '256 GiB' memory on 'GCP'; and 'Exposed Ports' with a 'Tunnels: jupyter:8888' entry. On the right, a pricing section shows '\$0.85/hr' and a 'Choose a Cloud Provider' section with 'GCP' selected as 'Creator's Choice' and 'SCALEWAY' as an alternative. A 'Deploy Launchable' button is prominently displayed at the bottom right, accompanied by a consent statement: 'By clicking "Deploy", I consent to sharing my personal and deployment data with GCP as described [here](#).'

CUDA-Q Application Hub provides easy access and streamlined experimentation with sample applications across domains, such as quantum chemistry, AI, and optimization.

- **Pre-built “Launchable” — launch CUDA-Q in 1 click:**

- [CUDA-Q Application Hub](#) (VM mode)
- [CUDA-Q Launchable](#) (Docker mode)
